Abstract (Basic): US 20010007055 A1

NOVELTY - Electrodes (16-20) are contacted with body of person under test and measurement current is fed through electrodes (16,17). Arithmetic unit calculates bioelectrical impedance based on voltage difference between electrodes (19,20). Degree of fatigue of person is determined by comparing currently measured and reference values of bioelectrical impedance stored in memory. LCD (4) indicates fatigue degree of person.

USE - For determining degree of fatigue such as swelling in legs, calf of person under test.

ADVANTAGE - Degree of fatigue of person is determined simply by comparing currently measured and previously measured bioelectric impedance.

DESCRIPTION OF DRAWING(S) - The figure shows the external overview illustrating apparatus for determining degree of fatigue of human body.
